Middleware

Spryker understands more than anyone how much heavy lifting integrations do to make sure the your systems are working together. This is why we created the **Spryker Middleware**. It is a powerful tool that allows you to merge your most important service providers, data resources, and third-party systems with the Spryker Commerce OS.

Spryker Middleware supports integrations with several ERP and CRM systems, such as:

Spryker Middleware has successfully integrated with SAP Version is ECC 6.0 SP 7, and custom JSON webservices on SAP side. It is built to make integrating with other large ERP systems like **Microsoft Dynamics** and **Salesforce** a seamless experience through reading, writing, and translating your most valuable information in a stable and reliable way.

Our Middleware is a toolset which connects and transfers data through a pipeline that contains five stages: reader, validator, mapper, translator, writer. **These work together along with the vendor specific reader and writer to make sure all integrations work with the Spryker system no matter what enterprise solutions you already use.**

If you have other legacy integrations that has not been worked with yet, don't worry. Spryker can customize any software integration, and will work with you to build a secure and dependable solution through the Spryker Middleware.
